

(Veriato) Vision

Deploy Using the MSI Installer

Using the MSI Installer

The Add Agents wizard offers two Windows Installers: an .exe and an .msi file. Both installers are "silent," requiring no interaction once launched.

Download one or both installers from **Admin | Download Agents**. Once you press **Generate** on the step 3 of the wizard, you can choose to **Download** one or both files. The best installer to use depends on how you intend to deploy the file to endpoint devices.

Silent EXE Installer

When executed, the .exe file installs the recorder agent silently and registers automatically with the Veriato Vision server. No additional switches are required. Use the .exe file to deploy:

- Locally at an endpoint device (double-click the file)
- Using our **NetDeploy** tool
- Using **PsExec**
- Using **ConnectWise Manage**
- Using **Microsoft Intune** (once the .exe is converted to .intunewin)
- Using another tool that accepts an EXE install file

The EXE Installer includes an Uninstaller (the MSI Installer does not).

Silent MSI Installer

The MSI installer is our.exe silent installer in an Microsoft Windows Installer (MSI) wrapper. Use the .msi file to deploy:

- Locally at an endpoint device (double-click the file)
- Using **Group Policy Object** (GPO requires MSI)
- Using another tool requiring MSI for network-based deployments

Learn about GPO deployment here:

<https://learn.microsoft.com/en-us/troubleshoot/windows-server/group-policy/use-group-policy-to-install-software>

You can deploy both the EXE and MSI Installers silently across a network. However, we recommend using the EXE Installer when possible. Here's why:

- **The MSI leaves an entry in Windows Add/Remove Programs.**
The entry remains even after the software is installed, appearing as a generic "Security Update."
- **The entry must be removed before redeploying to an endpoint.**
This could cause extra steps for agent updates. If you are using GPO to deploy, because of this entry, you must remove the GPO policy and then redeploy.

NOTE: Future agent installed using either the EXE or MSI installer will be updated using an automated process that does not require redeployment.
